**chapter 7 - atmospheric circulations - weather** - turbulence aloft (wind shear) formation of clear air turbulence (cat), responsible for 'air pockets' wind shear occurs at all altitudes and it can be horizontal or vertical at high altitudes, shear is encountered at the jet stream with the wind increasing from less than 50 mph to 150 mph over a few miles.

**turbulence dissipation rate in the atmospheric boundary ...** - turbulence dissipation rate in the atmospheric boundary layer: observations and wrf mesoscale modeling during the xpia field campaign domingo muñoz-esparza and robert d. sharman national center for atmospheric research, boulder, colorado julie k. lundquist department of atmospheric and oceanic sciences, university of colorado boulder, boulder ...

**mesoscale forecast analysis of atmospheric boundary layer ...** - signal attenuation sources such as turbulence-driven fluctuations in the atmospheric refractive index and gaseous absorption. an assessment of attenuation effects in the atmospheric boundary layer was afforded by the terrain-induced rotor experiment (t-rex), which was a large-scale, observational study involving participants

**penetrative turbulence associated with mesoscale surface ...** - penetrative turbulence for 6 values of  $h_0$ . a purpose of these simulations is to understand the sensitivity of high-amplitude surface heat-flux heterogeneity for temporal oscillation in mesoscale atmospheric circulations. validation the total heat flux is composed of the turbulent and the viscous components, where the

**what is mesoscale - department of geological and ...** - what is "mesoscale"? • meaning is: "middle scale" or "in-between" scale • synoptic - mesoscale - convective scale • division of scales is not rigid - there is a continuum so that any phenomena is affected by other scales. for example, convective elements organized into a mesoscale system have both important convective

**mesoscale dynamics - university of oklahoma** - mesoscale dynamics uses a dynamical approach for the study of atmospheric phenomena with a horizontal scale ranging approximately from 2 to 2000 km. these mesoscale phenomena include, but not limited to, thunderstorms, squall lines, supercells, mesoscale convective complexes, inertia-gravity waves, mountain waves, low-level jets,

**atmospheric turbulence estimates from a pulsed lidar** - the mesoscale model used in this analysis was the national center for atmospheric research's (ncar) weather research and forecast (wrf) model. the edr is diagnosed from the wrf model output of turbulence kinetic energy (tke) and the master length scale. the advantage of the mesoscale model estimates is that they can provide

**nested mesoscale-to-les modeling of the atmospheric ...** - nested mesoscale-to-les modeling of the atmospheric boundary layer in the presence of under-resolved convective structures l. j. mazzaro<sup>1,2</sup>, dnoz-esparza<sup>~ 3</sup>, ... turbulence characteristics, turbulent partitioning between the vertical and horizontal directions, and the
